INT.CL. : H01L 21/338 H01L 29/812

TITLE : SEMICONDUCTOR DEVICE AND ITS  
MANUFACTURE

ABSTRACT : PURPOSE: To obtain the title semiconductor device provided with an n-channel GET whose high-speed electron mobility can be utilized effectively by forming the n-channel FET composed of the following: a substrate composed of an SiGe mixed crystal; a channel layer which has been formed on it and which is composed of Ge or an SiGe mixed crystal; an SiGe mixed crystal layer; and a gate electrode.

CONSTITUTION: The title semiconductor device is provided with the following: a substrate 41 composed of an  $\text{Si}_{1-x}\text{Ge}_x$  (where  $0.7 \leq x \leq 0.85$ ) mixed crystal; and a channel layer 17 which is formed on the substrate 41 and which is composed of Ge or an  $\text{Si}_{1-z}\text{Ge}_z$  (where  $0.9 \leq z < 1$ ) mixed crystal. In addition, the title semiconductor device is provided with an n-channel FET which is constituted of the following:  $\text{Si}_{1-y}\text{Ge}_y$  (where  $0.7 \leq y \leq 0.85$ ) mixed crystal layers 18, 20 formed on the channel layer 17; and a gate electrode 23 provided so as to form a channel in the channel layer 18. For example, a Ge channel layer 17 and an  $\text{Si}_{0.2}\text{Ge}_{0.8}$  layer 18 are epitaxially grown on a p-type  $\text{Si}_{0.2}\text{Ge}_{0.8}$  substrate 41. Then, Sb 19 is controlled to be a monoatomic layer or lower and adsorbed; after that, an  $\text{Si}_{0.2}\text{Ge}_{0.8}$  layer 20 and an Si layer 21 are deposited.
